## Introduction

#### Data

```
df <- read_csv("data/class_wide_1.csv")

## Parsed with column specification:
## cols(
## .default = col_double(),
## speaker = col_character(),
## `54` = col_character()
## )

## See spec(...) for full column specifications.</pre>
```

# Clustering

#### Introduction

In this task, individuals heard spoken speech tokens and freely classified them into groups. Using hierarchical clustering we aim to see what clusters or groups appear as a result of the free classification task.

```
library(here)
library(tidyverse) # data manipulation
library(cluster) # clustering algorithms
library(factoextra) # clustering visualization
library(dendextend) # for comparing two dendrograms
```

#### **Data Preparation**

- 1. Rows are observations (individuals) and columns are variables
- 2. Any missing value in the data must be removed or estimated.
- 3. The data must be standardized (i.e., scaled) to make variables comparable (I am not doing this here)

#### Read in the data

```
clust_data <- read_csv(here("data", "class_wide_1.csv")) # read in data</pre>
## Warning: Missing column names filled in: 'X1' [1]
## Parsed with column specification:
## cols(
##
     .default = col_double(),
     speaker = col_character(),
##
     `54` = col character()
## )
## See spec(...) for full column specifications.
clust_data <- select(clust_data, -X1, -`54`) # remove extra col sub 54 has weird formatting
clust_data <- as.data.frame(clust_data) # turn into df</pre>
rownames(clust_data) <- clust_data$speaker # make row names speaker
clust_data <- select(clust_data,-speaker) # remove extra col sub 54 has weird formatting</pre>
head(clust_data)# show first couple rows

#### **Agglomerative Hierarchical Clustering**

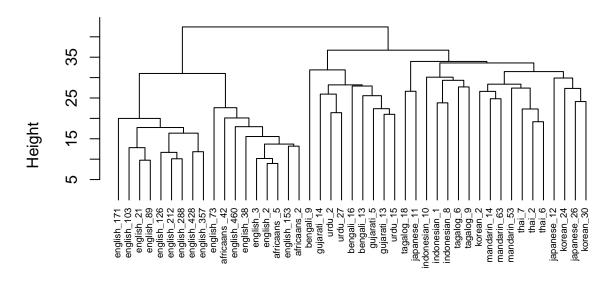

I am going to cluster the data using average link clustering. Average link clustering computes all pairwise dissimilarities between the elements, and considers the average of these dissimilarities as the distance between clusters.

```
# Dissimilarity matrix
d <- dist(clust_data, method = "euclidean")

# Hierarchical clustering using Average Linkage
hc1 <- hclust(d, method = "average")

# Plot the obtained dendrogram
plot(hc1, cex = 0.6, hang = -1)</pre>
```

## **Cluster Dendrogram**

## d hclust (\*, "average")

In the dendrogram displayed above, each leaf corresponds to one observation. As we move up the tree, observations that are similar to each other are combined into branches, which are themselves fused at a higher height.

The height of the fusion, provided on the vertical axis, indicates the (dis)similarity between two observations. The higher the height of the fusion, the less similar the observations are. Note that, conclusions about the proximity of two observations can be drawn only based on the height where branches containing those two observations first are fused. We cannot use the proximity of two observations along the horizontal axis as a criteria of their similarity.

The height of the cut to the dendrogram controls the number of clusters obtained. It plays the same role as the k in k-means clustering. In order to identify sub-groups (i.e. clusters), we can cut the dendrogram with cutree:

```
# Ward's method
hc5 <- hclust(d, method = "average" )

# Cut tree into 4 groups
sub_grp <- cutree(hc5, k = 3)

# Number of members in each cluster
table(sub_grp)

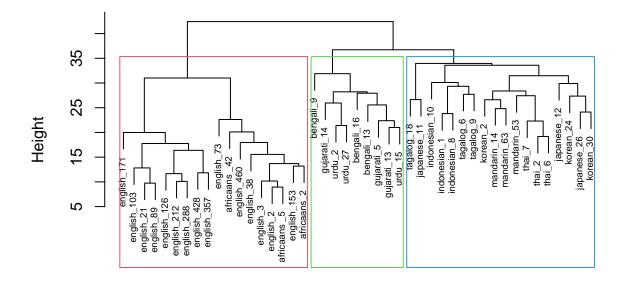

## sub_grp
## 1 2 3
## 9 18 18

## sub_grp
## 1 2 3 4
## 7 12 19 12</pre>
```

## Visualize clusters on dendrogram

```
plot(hc5, cex = 0.6)
rect.hclust(hc5, k = 3, border = 2:5)
```

# **Cluster Dendrogram**

# d hclust (\*, "average")

From this, we glean that 3 clusters seem to be adequate. Generally participants groups speakers into 3 clusters/groups:

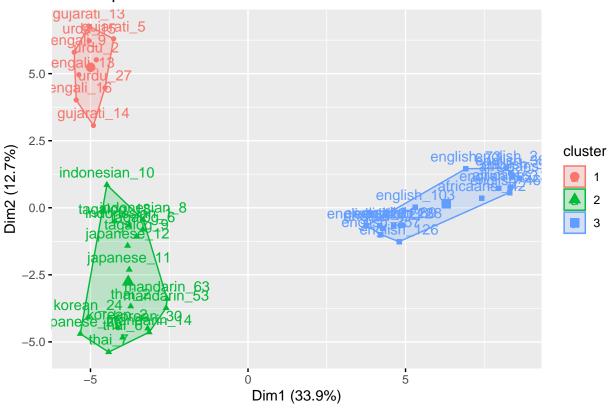

English/African: Clust 1Indo/European: Clust 2

• Asian: Clust 3

```
clust_data <- clust_data %>%
  mutate(cluster = sub_grp)

fviz_cluster(list(data = clust_data, cluster = sub_grp))
```

## Cluster plot

## Full Code

The full script of executive code contained in this document is reproduced here.

```
df <- read_csv("data/class_wide_1.csv")
library(here)
library(tidyverse) # data manipulation
library(cluster) # clustering algorithms
library(factoextra) # clustering visualization
library(dendextend) # for comparing two dendrograms

clust_data <- read_csv(here("data", "class_wide_1.csv")) # read in data
clust_data <- select(clust_data, -X1, -`54`) # remove extra col sub 54 has weird formatting
clust_data <- as.data.frame(clust_data) # turn into df
rownames(clust_data) <- clust_data$speaker # make row names speaker</pre>
```

```
clust_data <- select(clust_data,-speaker) # remove extra col sub 54 has weird formatting</pre>
head(clust_data)# show first couple rows
# Dissimilarity matrix
d <- dist(clust_data, method = "euclidean")</pre>
# Hierarchical clustering using Average Linkage
hc1 <- hclust(d, method = "average" )</pre>
# Plot the obtained dendrogram
plot(hc1, cex = 0.6, hang = -1)
# Ward's method
hc5 <- hclust(d, method = "average" )</pre>
# Cut tree into 4 groups
sub_grp \leftarrow cutree(hc5, k = 3)
# Number of members in each cluster
table(sub_grp)
## sub_grp
## 1 2 3 4
## 7 12 19 12
plot(hc5, cex = 0.6)
rect.hclust(hc5, k = 3, border = 2:5)
clust_data <- clust_data %>%
  mutate(cluster = sub_grp)
fviz_cluster(list(data = clust_data, cluster = sub_grp))
```
